What is a computer network?

A computer network is a set of computers connected together for the purpose of sharing resources. (Source: MOD 1 NOTES.pdf, page 1)

> Sources

What is networking?

Networking is the total process of creating and using computer networks, involving hardware, protocols, and software, including wired and wireless technology【MOD 1 NOTES.pdf, Page 1】.

> Sources

List the uses of computer networks.

Uses of Computer Networks

- Access to Information

- Person-to-Person Communication
- Electronic Commerce
- Entertainment
- The Internet of Things

Sources

What is the client-server model?

The client-server model is a network architecture in which a **client** sends a request for information to a **server**, and the server processes that request and sends back a response. This model is commonly used for web applications, where the server generates web pages in response to client requests.

Sources

What is peer-to-peer communication?

Peer-to-peer (P2P) communication is a network model in which participants communicate directly with one another without a fixed division into clients and servers. In a P2P system each node can act as both a client and a server, allowing direct data exchange between peers【MOD 1 NOTES.pdf, Page 2】.

Sources

Give two examples of person-to-person communication over networks.

Two examples of person-to-person communication over networks are:

1. **Email** – a widely used global method that can include audio, video, text, and pictures.
2. **Instant messaging** – popular for real-time text communication between individuals.

What is the Internet of Things (IoT) used for, according to the notes?

According to the notes, the Internet of Things (IoT) is used to connect nearly every electronic device to the Internet, enabling continuous measurement and reporting. It supports smart-home monitoring (e.g., door/window sensors, smoke detectors that alert the fire department), smart utility meters that report electricity, gas, and water usage, and devices that can automatically reorder supplies such as groceries when stocks run low.

What is a Personal Area Network (PAN)?

A Personal Area Network (PAN) is a short-range network that enables communication between devices in close proximity, such as connecting a computer to peripherals or linking wireless headphones and smartphones. It typically uses technologies like Bluetooth, which simplifies these connections without cables, using a master-slave model where the PC manages other devices.

What is a Local Area Network (LAN)?

A Local Area Network (LAN) is a private network used within a building—such as a home or office—to connect and share resources like printers and information among computers and other electronics.
Source: MOD 1 NOTES.pdf, page 7.

> Sources

What area does a Metropolitan Area Network (MAN) cover?

A Metropolitan Area Network (MAN) covers an entire city.
(Source: MOD 1 NOTES.pdf, page 8)

> Sources

What is a Wide Area Network (WAN)?

A Wide Area Network (WAN) is a network that spans large geographic areas—such as countries or continents—connecting multiple locations. It typically includes a subnet (the communication part of the WAN, made up of transmission lines like fiber or copper and routers that direct data traffic), routing and forwarding functions (routers determine the best data paths and send packets to their destinations), management (hosts and the subnet are often managed separately, with WANs linking different networking technologies and sometimes entire LANs), and internetworks (many WANs combine various networks and technologies into one system)【MOD 1 NOTES.pdf, Page 9】.

> Sources

What is an internetwork?

An internetwork is a collection of interconnected networks that connects distinct networks—such as LANs and WANs or two LANs—often involving different hardware and software technologies. It is created to allow those networks to communicate with one another. (Source: MOD 1 NOTES.pdf, page 9)

> Sources

What does ARPANET stand for in the notes?

ARPANET stands for “Advanced Research Project Agency Network.”
Source: MOD 1 NOTES.pdf, page 10.

> Sources

What technology did ARPANET use to interconnect four nodes?

ARPANET used **packet-switching technology** to interconnect the four nodes.
Source: *MOD 1 NOTES.pdf*, page 10.

What are the main differences listed for 1G, 2G, and 3G?

Main differences for 1G, 2G, and 3G

- **1G (e.g., AMPS, 1982)** – used analog signals for voice.
- **2G (e.g., GSM, 1991)** – introduced digital voice and text messaging.
- **3G (e.g., UMTS, 2001)** – added broadband data services with speeds up to 14 Mbps downlink.
